

Testing
motor skills
is as easy
as MABC

**Movement Assessment Battery
For Children • THIRD EDITION**

When a motor coordination delay or disorder is suspected, having a quick and reliable screening tool is imperative in ensuring interventions are put in place as early as possible, and in gauging the efficacy of those interventions over time. For many Occupational and Physiotherapists, School and Neuro Psychologists, and other professionals all over the world, that tool is the Movement ABC.

The updated MABC-3 will include many of the features and benefits current MABC-2 users enjoy, with some modifications that will expand its usefulness and make it even more user-friendly. Some of these changes include:

- An expanded age range that extends use from 3 years up to 25 years
- An additional manual dexterity item per age band
- An additional aiming and catching item per age band
- Digital scoring and reporting options on Q-global
